

# Business cabin idea promotes in-flight collaboration

Posted on June 22, 2021 by News Editor

Students from the German Aerospace Center have developed a concept for business class cabins that would enable travelers to more easily collaborate with colleagues during a flight, while still allowing privacy if passengers prefer to sleep or have alone time. The multipurpose business area includes seats that can rotate 180 degrees, a large table surface that can be pulled out of the wall and an Organic Light-Emitting Diode display that can be viewed by a group of up to four people.
